June 16, 2026

**Preliminary Precipitation and Temperature Summary**  
**May 2026.**

**Highlights**

May 2026 brought above-normal rainfall to Nepal. The country received 170.3 mm of precipitation on average, compared to the normal of 133.7 mm (based on 1991-2020 data). This equals 127.4% of the normal rainfall. Maximum temperatures stayed below normal across the country, while minimum temperatures remained near normal.

**Synoptic Sequence**

**1-5 May**

An active Western Disturbance lingered over Kashmir. It triggered upper-air cyclonic circulations over Punjab and Haryana. Nepal experienced westerly and local winds during this period. A low-pressure area formed near eastern Nepal, and an east-west trough stretched across the southern plains. Together, these systems produced the first rainfall peak around 3-5 May.

**6-14 May**

A series of Western Disturbances crossed northwest India. These appeared as troughs in the middle and upper westerly winds, moving eastward from 60°E to 80°E. They created circulations over Rajasthan, Uttar Pradesh, and Haryana. Lower-level troughs also extended toward the Arabian Sea and central India. Nepal remained under a western low-pressure system with local winds. Rainfall reached its lowest point around 11 May.

**15-26 May**

New Western Disturbances approached from west and north Iran. They moved toward north Pakistan and Jammu, carrying troughs across the Indo-Gangetic Plain. The low-pressure area in eastern Nepal remained active. Rainfall increased sharply again, reaching a second peak around 26 May. This happened when a Western Disturbance intensified over Jammu and a trough stretched from Punjab to the northeast Arabian Sea.

**27-31 May**

An upper-air cyclonic circulation developed over central Uttar Pradesh. A new Western Disturbance deepened over northwest Uttar Pradesh between 3.1 and 7.6 km altitude. On 31 May, this system merged with a circulation over Haryana. Nepal fell under the influence of an upper-level western trough and an east-west low-pressure line along its southern border. These conditions produced a late-month rainfall peak around 29 May. Afterward, the system moved away and weather activity decreased.

**Precipitation**

In May 2026, most regions received more than 75 mm of rainfall. Only the Himalayan areas of Sudurpashchim and Karnali Provinces, and parts of Gandaki Province, fell below this threshold. Some areas in Gandaki, Bagmati, Madhesh, and Koshi Provinces received over 200 mm. A few stations in Koshi and Gandaki Provinces even recorded more than 500 mm. Overall, central and eastern Nepal received more rain than western Nepal (Figure 1).

Figure 1 Total precipitation in May 2026

Most of the country recorded above-normal rainfall. The Terai and Hilly regions received above-normal precipitation. The Himalayan region, however, saw normal to below-normal rainfall. The Terai area of western Nepal showed the highest percentage of normal rainfall compared to other regions (Figure 2). Gandaki, Bagmati, and Koshi Provinces had the most rainy days (Figure 3).

*Figure 3: Number of Rainy days ( $\geq 1$ mm) during May 2026*

Kechana station in Jhapa District recorded the highest single-day rainfall of 172.9 mm on 21 May. Num station in Sankhuwasabha District recorded the highest monthly total of 752.6 mm. Jomsom station in Manang District recorded the lowest monthly total at 13.9 mm. Three stations exceeded 500 mm for the month: Num in Sankhuwasabha, and Malepatan Pokhara and Pokhara Airport in Kaski. Ninety-five stations recorded between 100 mm and 500 mm. The remaining 25 stations with measurable rainfall recorded less than 100 mm (Annex 1). Based on data from 126 stations, Nepal received 127.4% of its normal May rainfall. Taulihawa station in Kapilvastu District recorded the highest percentage of normal rainfall at 373.7%.

The cumulative daily rainfall stayed above normal throughout the entire month (Figure 4). The wettest May on record since 1981 was 2021. This year's May rainfall was slightly higher than May 2025 (Figure 5).

## Maximum Temperature

Maximum temperatures in the Terai stayed above 27°C. Western Terai regions even crossed 36°C. Most northern areas of the country recorded maximum temperatures below 6°C (Figure 6).

Nepalgunj Regional Office in Banke District recorded the highest monthly average maximum temperature at 36.9°C. Humde station in Manang District recorded the lowest at 15.6°C. Mangalsen station in Achham District showed the largest positive anomaly at 2.1°C above normal. Khajura Nepalganj station in Banke District showed the largest negative anomaly at 3.9°C below normal (Annex 1). The hottest single day reached 42.0°C at Khajura Nepalganj on 21 May. The coolest day reached 9.8°C at Humde on 30 May.

Figure 6: Maximum Temperature in May 2026

Maximum temperatures ran below normal across almost the entire country. Only some northern parts of Karnali Province were exceptions. Temperature departures stayed mostly between  $-3^{\circ}\text{C}$  and  $+1^{\circ}\text{C}$  (Figure 7). Overall, May 2026 brought below-normal maximum temperatures (Figure 8).

### Minimum Temperature

Average minimum temperatures in the Terai stayed above 21°C. The Hilly region recorded minimums between 6°C and 21°C. Most of the Himalayan region saw minimums below 3°C, with some areas dropping below -9°C (Figure 9).

Bagmati, Madhesh, and Sudurpashchim Provinces, along with parts of Koshi and Gandaki Provinces, recorded below-normal minimum temperatures. The rest of the country saw normal to above-normal minimums (Figure 10). For Nepal as a whole, minimum temperatures remained near normal (Figure 11).

Chisapani station in Kailali District recorded the highest monthly average minimum temperature at 24.5°C. Humde station in Manang District recorded the lowest at 2.4°C. Talcha station in Mugu District had the largest positive anomaly at 8.8°C above normal. Dunai station in Dolpa District had the largest negative anomaly at 2.9°C below normal (Annex 1). The warmest night reached 29.6°C at Bhairahawa Agricultural Station in Rupandehi on 19 May. The coldest night dropped to -3.0°C at Humde on 11 May (Annex 1).

### Diurnal Temperature Range

Most of the country had a diurnal temperature range (DTR) below 16°C. DTR measures the difference between daily maximum and minimum temperatures. Two stations recorded higher values: Dunai in Dolpa District at 18.4°C, and Jumla Airport in Jumla District at 17.0°C. Karnali and Sudurpashchim Provinces showed larger DTR values than other provinces. Illam Tea Estate recorded the smallest DTR at 7.0°C. The map shows the average daily DTR for each station (Figure 12).

**Note:**

- This summary is prepared based on the precipitation and temperature recorded at 126 meteorological stations.
- Normal precipitation/temperature is the average of the monthly precipitation/temperature for the period of 1991-2020. An asterisk (\*) indicates locations where normal data are unavailable; in such cases, the values are average over the available data period. In case of precipitation, less than 90% of normal precipitation is considered as below normal, 90 to 110% is considered as near normal, and more than 110% of normal precipitation is considered as above normal precipitation for the month.
- Abbreviation: "No." = number; "hr" = hour; "mm" = millimeter; "temp" = temperature; "/" or "-" = Data Not Available; "Dep." = departure; "Tx" = Maximum temperature; "DTR" = Diurnal Temperature Range
